New Cabin Tilt Cylinder provides more safety

Hydraulic cabin tilt systems have proven their worth and are now the technical standard for European commercial vehicle manufacturers. They allow the cab to be tilted with relatively little effort to provide access to the engine.

Large forces can be transmitted via hydraulic systems. In the event of an accident, this also applies inadvertently. If the cab is pushed backwards by an impact, the hydraulically blocked tilt cylinder holds the cab in its position unyieldingly. In the past, this has often led to considerable deformation of the cab and to serious injuries.

The new patented cab tilt cylinder febi 101044 gives way in the event of a crash and allows the cab to move backwards from its position. This means less deformation of the cab and the decreased risk of injury for the driver.

In addition to the cabin tilt cylinder febi 101044, febi offers the corresponding cab tilting pumps febi 104114 and febi 103244 for Volvo FH (G4) Euro 6.
